                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN CROSS-LINKED BY A DISULFIDE BOND.

SUBCELLULAR LOCATION: LYSOSOMAL.

DISEASE: DEFECTS IN CTSC ARE A CAUSE OF PAPILLON-LEFEVRE SYNDROME (PLS) ALSO KNOWN AS KERATOSIS PALMOPLANTARIS WITH PERIODONTOPATHIA. IT IS AN AUTOSOMAL RECESSIVE DISORDER THAT IS MAINLY ASCERTAINED BY DENTISTS BECAUSE OF THE SEVERE PERIODONTITIS THAT AFFLICTS PATIENTS. BOTH THE DECIDIOUS AND PERMANENT DENTITIONS ARE AFFECTED, RESULTING IN PREMATURE TOOTH LOSS. PALMOPLANTAR KERATOSIS, TYPICALLY DEVELOPS WITHIN THE FIRST THREE YEARS OF LIFE. KERATOSIS ALSO AFFECTS OTHER SITES SUCH AS ELBOWS AND PERMANENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biol.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE
GENERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENZYMES:

(1) ENDOGLUCANASES WHICH CUT INTERNAL BETA-1, 4-GLUCOSIDIC BONDS;

(2) EXOCELLOBIOHYDROLASES THAT CUT THE DISSACCHARIDE CELLOBIOSE
FROM THE NONREDUCING END OF THE CELLULOSE POLYMER CHAIN;
FROM THE NONREDUCING END OF THE CELLULOSE POLYMER CHAIN;

(3) BETA-1, 4-GLUCOSIDASES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER
SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.
                                                                                                                                                                                                                                                             Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAUTION: WAS ORIGINALLY CALLED ENDOGLUCANASE EG-III.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SIMILARITY: BELONGS TO CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic linkages in cellulose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HYDROLASES).
SIMILARITY: CONTAINS 1 FUNGAL-TYPE CELLULOSE-BINDING DOMAIN (CBD).

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB

 Cucumber expansin-29 (AAR94527) is a member of a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. It can be obtained by the contract of the
 Expansins are a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. 2 Expansins (AAR94528 and AAR94529) have been identified rice and 3 in Arabidopsis (AAR94530-32). A cDNA clone (AAT13320)
 expansin-29; plant cell wall; cellulose;
polysaccharide; cucumber.
 coding for cucumber expansin 29 (AAR94527) has been obtd. Expancan be used e.g. in the mfr., de-inking and recycling of paper, the textile industry, to aid delignification processes, to altermechanical strength, etc.

 other host cells. Expansin proteins have also been identified in oat coleoptiles, in Arabidopsis (see AAR94530-32) and in rice (AAR94528-29), and appear to be broadly distributed throughout the plant kingdom. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.

 pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 Expansins are a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. 2 Expansins (AAR94528 and AAR94529) have been identified rice and 3 in Arabidopsis (AAR94530-32). A cDNA clone (AAT13320) coding for cucumber expansin 29 (AAR94527) has been obtd. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.

 other host cells. Expansin proteins have also been identified in oat coleoptiles, in Arabidopsis (see AAR94530-32) and in rice (AAR94528-29), and appear to be broadly distributed throughout the plant kingdom. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.

                                                                                                                                                                                                                                                                                  Expansins are a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. 2 Expansins (AAR94528 and AAR94529) have been identified rice and 3 in Arabidopsis (AAR94530-32). A cDNA clone (AAT13320) coding for cucumber expansins 29 (AAR94527) has been obtd. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oryza sativa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Expansin; plant cell wall; cellulose; paper recycling; de-inking;
